

Fictional Probe Retry Routine

This invented example checks whether indentation, punctuation, and line boundaries survive passage capture.

```
function readProbe(probe) {  
  const sample = probe.read();  
  if (!sample.valid) {  
    return null;  
  }  
  return sample.value;  
}
```

The selected code line is two spaces, `const sample = probe.read();`, including its leading indentation and trailing semicolon.
