

The Alder Pump Demonstration Rig

The fictional Alder rig uses a clear reservoir, a hand-operated pump, and a return line. The reservoir sits below the pump so a learner can see when the inlet remains flooded.

Before each demonstration, the operator closes the drain, fills the reservoir to the marked seam, and checks that the return hose is free of sharp bends. These steps describe the setup rather than a real product procedure.

The selected chamber stays full while the handle rises. This sentence is the stable mid-page selection used by the passage-capture test.

When the handle falls, the outlet flap opens and the inlet flap closes. The visible sequence makes the direction of flow easier to inspect without relying on a brand-specific drawing.

Alder Rig - Second Page

The second page begins with a continuation paragraph so the reader spike can record that selections spanning pages are unavailable rather than silently corrupted.

A separate observation line confirms that a same-page location can still be restored after the document is reloaded.
