

Marlowe Thermal Loop Notes

The fictional Marlowe loop moves tinted water through a heater, a clear rise tube, and a cooling coil. Each part is generic and exists only for this test document.

Warm water enters the rise tube at the lower left. The visible column becomes less dense and moves upward while the cooler return remains on the opposite side.

The left-column selection ends before the gutter. It must not continue into the right column until the reader reaches the next logical block.

The cooling coil returns water toward the reservoir. A narrow air gap above the water leaves room for expansion during the classroom demonstration.

The right-column selection begins after the gutter. Reading order is correct only when the extracted text finishes the left column before starting this paragraph.

A final note states that no temperatures, brands, or operating limits are asserted by this fictional fixture.
